

基于网络API的 音乐下载器的实现

讲述人：黄晓阳

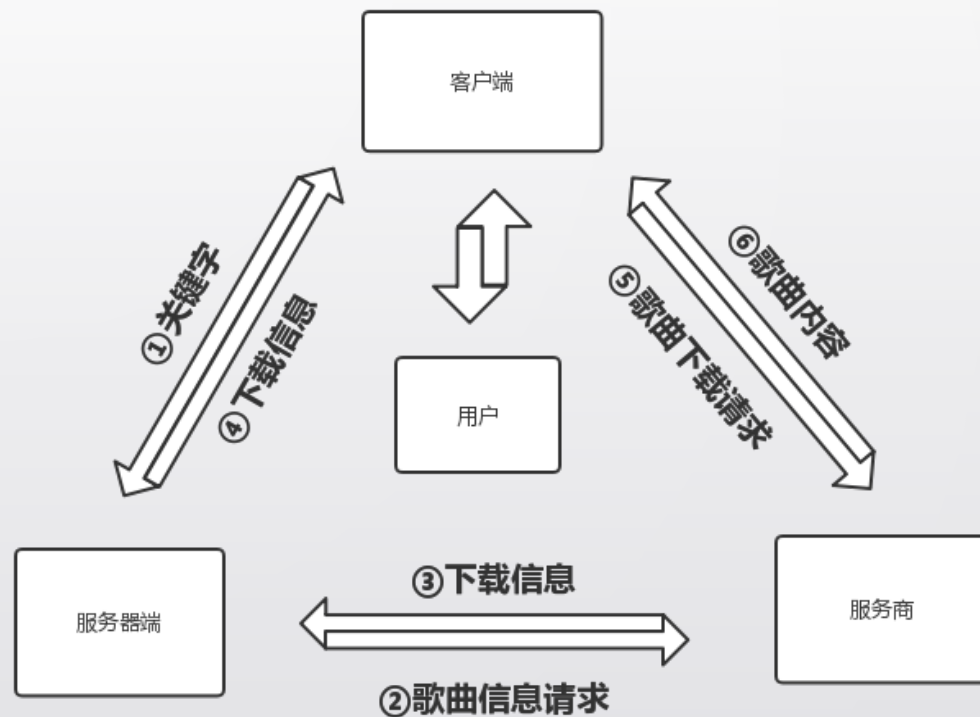

学号：2015300005

遇到的问题:

实现流程：

- 1、客户端向服务器发送关键字
- 2、服务器向API接口请求歌曲信息
- 3、服务商向服务器发送下载信息
- 4、服务器向客户端回传下载信息
- 5、客户端收到数据并向用户展示结果
- 6、用户将结果进行筛选并下载

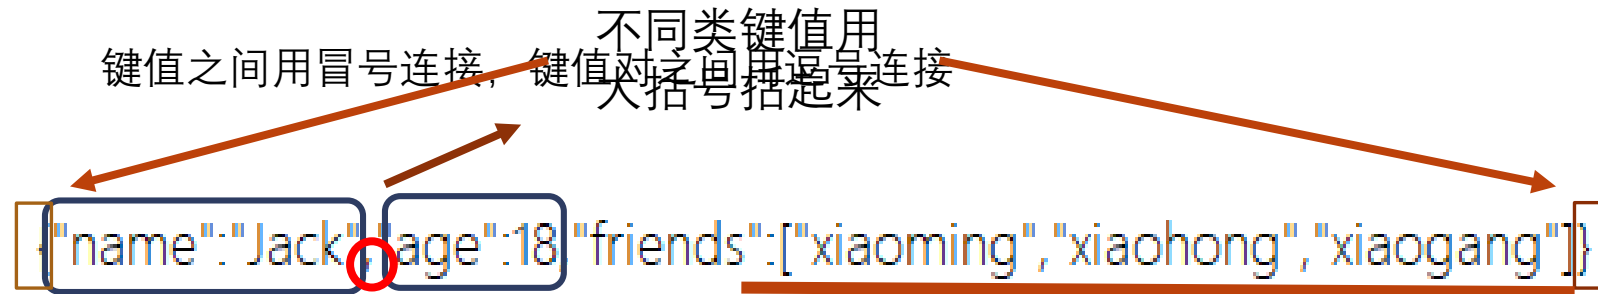

- 
- 基础知识:
 - JSON格式简介
 - 网络API简介
 - 云服务器简介

- 代码实现:
- 服务器的功能
- 客户端的功能
- 最终结果展示

JSON格式简介 (客户端、服务器端、服务商之间的桥)

键值之间用冒号连接，键值对之间用逗号连接
不同类键值用大括号括起来

```
{ "name": "Jack", "age": 18, "friends": ["xiaoming", "xiaohong", "xiaogang"] }
```

同类型的值用中括号括起来

```
{ "name": "Jack", "friends": [{ "name": "xiaohong", "age": 17 }, { "name": "xiaoming", "age": 18 }] }
```

将以上基本规则组合就能够得到复杂的数据包

API接口简介 (服务器与服务商之间的桥)

以链接形式调用API, 根据参数不同返回不同的结果

The screenshot shows a web browser window with the address bar containing the URL: `https://www.sojson.com/open/api/weather/json.shtml?city=西安`. The browser's address bar and the URL itself are highlighted with a red rectangle. Below the address bar, there is a toolbar with various icons and a search bar. The main content area of the browser displays a JSON response from the API, which includes weather data for Xi'an, such as temperature, humidity, and forecast.

IP地址与端口简介 (客户端与云服务器之间的桥)

- IP地址，即对因特网上的每台计算机和其它设备都规定的一种唯一的地址，叫做“IP地址”，它保证了用户在连网的计算机上操作时，能够高效而且方便地从千千万万台计算机中选出自己所需的对象。
- TCP/IP协议集成到操作系统的内核中，这就相当于在操作系统中引入了一种新的输入/输出接口技术，因为在TCP/IP协议中引入了一种称之为“Socket（套接字）”应用程序接口，即端口。

songs_kugou = content_kugou['data']['lists']
for song_kugou in songs_kugou:
    data_kugou_song = requests.get(
        "http://m.kugou.com/app/i/getSongInfo.php?hash=" + song_kugou['FileHash'] + "&cmd=playInfo",
        headers=headers)
    data_kugou_song.close()
    content_kugou_song = json.loads(data_kugou_song.text)
    songList['kugou'].append(
        {'name': content_kugou_song['songName'], 'singer': content_kugou_song['singerName'],
        'url': content_kugou_song['url']})
```

向服务商api发送请求并
解析获取到的json格式，
从中提取歌曲名、歌手、
下载地址等信息。

将获得的信息以定义好的json格式添加到数据集中

客户端的实现:

- 向用户提供良好的交互界面
- 针对服务器提供的API协议, 实现与服务器之间的交互
- 根据获取的歌曲下载信息对相应的歌曲进行下载

```
public void search()
{
    IPAddress ip = IPAddress.Parse("47.95.202.222");
    IPEndPoint point = new IPEndPoint(ip, int.Parse("10251"));
    Socket client = new Socket(AddressFamily.InterNetwork, SocketType.Stream, ProtocolType.Tcp);
    try
    {
        client.Connect(point);
    }
    catch
    {
        MessageBox.Show("链接出错!");
        Application.Exit();
    }

    byte[] buffer_send = Encoding.UTF8.GetBytes(textBox1.Text);
    client.Send(buffer_send);
    byte[] buffer_recv = new byte[1024 * 1024];
    int n = client.Receive(buffer_recv);
    String abc = Encoding.UTF8.GetString(buffer_recv, 0, n);
    Class1 package = JsonConvert.DeserializeObject<Class1>(abc);
    MyInvoke mi = new MyInvoke(display);
    this.BeginInvoke(mi, package);
}

public void download(Object group)
{
    Class3 GR = (Class3)group;
    WebClient myWebClient = new WebClient();
    myWebClient.DownloadFile(GR.url, path_ + @"\" + GR.name + GR.i + ".mp3");
}
```

根据已知的IP以及定义好的端口实现与服务器端的socket连接。

与服务器端进行通讯获取信息并对获取的信息进行解析。

根据获得的歌曲链接进行下载操作

谢谢大家！
